

# Git

This page describes the new Git plugin available in trunk.

## Why use the Git plugin

The Git plugin is useful if you would like to track changes to your bcfg2 repository using a [Git](#) backend. Currently, It enables you to get revision information out of your repository for reporting purposes. Future plans are to commit changes to the repo which are made by the server.

## How to enable the Git plugin

Simply add Git to your plugins line in /etc/bcfg2.conf

```
[server]
plugins = Base,Bundler,Cfg,DBStats,Decisions,Metadata,NagiosGen,Pkgmgr,Probes,Rules,SGenshi,SSHbase,TGenshi
```
